

Web Tension Start-Up

Application Service

Industry Sector(s) Paper and Pulp

The Customer

The customer is a major paper producer located in Sweden.

Customer Inquiry

The customer wanted to replace an aging and increasingly inaccurate system for web tension in one of its paper machines. Spare parts and technical support from the supplier were becoming more and more difficult to come by. Together, these problems had caused quality issues and downtime.

The customer also wanted to add more web tension units to get better control of the paper production process, enabling monitoring and control of the entire process, from the wet end to the dry end and also between each side (tending and drive side) of the machine.

Solutions and Equipment

We supplied the G4 instrument with force software, customized FMU- web tension units adapted to fit existing bearing houses, and mechanical installation supervision, start-up, calibration, and training.

Key Features:

- G4 multichannel instrument for monitoring the web tension
- Force software adapted for web tension, one and two channel blocks
- Short delivery and installation time
- Easy connection to the supervising control system
- Quick and easy start-up and calibration

Customer Comments

The customer was very happy with its upgraded web tension monitoring system, and in particular was pleased with our fast delivery, easy installation process, and fast learning curve for operators—since the measuring functions in the G4 instrument are based on configurable function blocks, and no mechanical adjustments are required.
